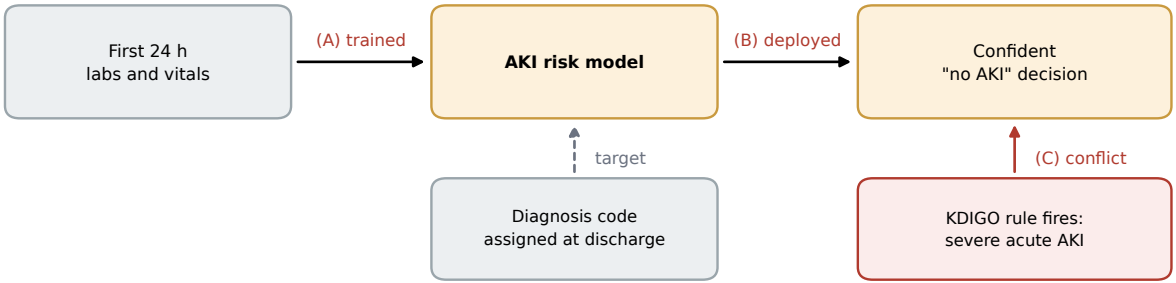
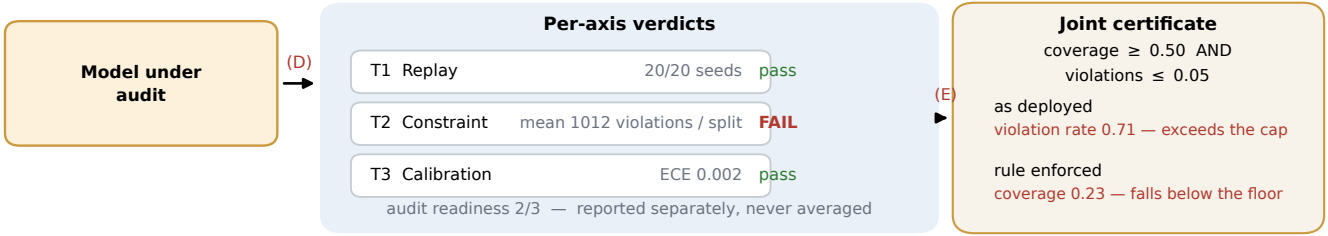
1. What is audited: a model trained on one authority, judged against another



MIMIC-IV, one hospital: 379k admissions, 167k patients. The two authorities agree on only 37% of the 5,954 cases where the rule fires. Replicated on eICU, a separate cohort of 170k ICU stays across 205 hospitals with a different labelling system.

2. What the audit reports: three axes, never collapsed, plus a joint certificate



3. Why the verdict is evidence: every threshold fixed in advance, every control declared

Pre-registration
all pass thresholds frozen
before any test fold

Negative controls
4 declared with the outcome
each must produce

Positive control
retrain on the guideline;
81% of the effect is arithmetic

Deviations log
17 numbered entries,
including what we did not deliver
